

AMENDMENTS TO THE CLAIMS

Please add new Claims 16-21 as indicated below.

Claims 1-8 (**Canceled**).

9. (**Original**) A method for controlling battery power comprising the acts of:
selectively providing a first external power source or a second external power source to a device coupled to a system power terminal;
coupling an internal battery to the system power terminal via a series-connected transistor; and
charging the internal battery by regulating the transistor to conduct a charging current in a first direction from the system power terminal to a positive battery terminal during a charging mode, wherein the charging current is linearly adjusted to prevent a supply current from exceeding a predefined threshold.
10. (**Original**) The method of Claim 9, further comprising the act of discharging the internal battery by regulating the transistor to conduct a discharging current in a second direction from the positive battery terminal to the system power terminal during a discharging mode.
11. (**Original**) The method of Claim 9, wherein the impedance of the transistor varies to limit the level of the charging current.
12. (**Original**) The method of Claim 9, wherein the charging mode occurs when the voltage on the system power terminal is greater than the voltage of the internal battery.
13. (**Original**) The method of Claim 10, wherein the discharging mode occurs when the voltage on the system power terminal is less than the voltage of the internal battery.
14. (**Original**) The method of Claim 10, wherein the discharging mode occurs in response to a discharge command.
15. (**Canceled**).

16. (New) A method for controlling power to a battery, the method comprising:
selectively providing an external primary power source or an external secondary power source to a system power terminal of a device with an internal battery;
coupling the internal battery to the system power terminal through a transistor;
and
adjusting a control terminal of the transistor with a driving signal to linearly regulate the level of current conducted by the transistor to charge the internal battery.
17. (New) The method of Claim 16, wherein the external primary power source is an AC adapter and the external secondary power source is a Universal Serial Bus power interface.
18. (New) The method of Claim 16, further comprising:
sensing current supplied by the external secondary power source and generating an associated current sense signal;
comparing the current sense signal with a threshold value; and
overriding the driving signal to reduce the transistor's current level when the current sense signal exceeds the threshold value.
19. (New) The method of Claim 16, wherein the transistor is a P-channel enhancement mode MOSFET with a source terminal coupled to the system power terminal and a drain terminal coupled to the internal battery.
20. (New) The method of Claim 16, wherein the transistor is a MOSFET with a configurable body contact.
21. (New) The method of Claim 16, wherein the external secondary power source is automatically disconnected from the system power terminal when the external primary power source is connected.
